Target

Business Case

Context

- Target is a globally renowned brand and a prominent retailer in the United States. Target makes itself a preferred shopping destination by offering outstanding value, inspiration, innovation and an exceptional guest experience that no other retailer can deliver.
- This particular business case focuses on the operations of Target in Brazil
 and provides insightful information about 100,000 orders placed between
 2016 and 2018. The dataset offers a comprehensive view of various
 dimensions including the order status, price, payment and freight
 performance, customer location, product attributes, and customer reviews.
- By analyzing this extensive dataset, it becomes possible to gain valuable insights into Target's operations in Brazil. The information can shed light on various aspects of the business, such as order processing, pricing strategies, payment and shipping efficiency, customer demographics, product characteristics, and customer satisfaction levels.

Dataset:

https://drive.google.com/drive/folders/1TGEc66YKbD443nslRi1bWgVd238gJCnb?usp=sharing

The data is available in 8 different csv files:

- 1. customers.csv
- 2. geolocation.csv
- 3. order items.csv
- 4. payments.csv
- 5. reviews.csv
- 6. orders.csv
- 7. products.csv
- 8. sellers.csv

The column description for these csv files is given below.

The customers.csv contain following features:

Features	Description
customer_id	ID of the consumer who made the purchase
customer_unique_id	Unique ID of the consumer
customer_zip_code_prefix	Zip Code of consumer's location
customer_city	Name of the City from where order is made
customer_state	State Code from where order is made (Eg. são paulo - SP)

The orders.csv contain following features:

Features	Description
order_id	A Unique ID of order made by the consumers
customer_id	ID of the consumer who made the purchase
order_status	Status of the order made i.e. delivered, shipped, etc.
order_purchase_timestamp	Timestamp of the purchase
order_delivered_carrier_date	Delivery date at which carrier made the delivery
order_delivered_customer_date	Date at which customer got the product
order_estimated_delivery_date	Estimated delivery date of the products

The order_items.csv contain following features:

Features	Description
order_id	A Unique ID of order made by the consumers
order_item_id	A Unique ID given to each item ordered in the order

product_id	A Unique ID given to each product available on the site
seller_id	Unique ID of the seller registered in Target
shipping_limit_date	The date before which the ordered product must be shipped
price	Actual price of the products ordered
freight_value	Price rate at which a product is delivered from one point to another

The payments.csv contain following features:

Features	Description	
order_id	A Unique ID of order made by the consumers	
payment_sequential	Sequences of the payments made in case of EMI	
payment_type	Mode of payment used (Eg. Credit Card)	
payment_installments	Number of installments in case of EMI purchase	
payment_value	Total amount paid for the purchase order	

The geolocations.csv contain following features:

Features	Description
geolocation_zip_code_prefix	First 5 digits of Zip Code
geolocation_lat	Latitude
geolocation_lng	Longitude
geolocation_city	City
geolocation_state	State

The sellers.csv contains following features:

Features	Description
seller_id	Unique ID of the seller registered
seller_zip_code_prefix	Zip Code of the seller's location
seller_city	Name of the City of the seller
seller_state	State Code (Eg. são paulo - SP)

The reviews.csv contain following features:

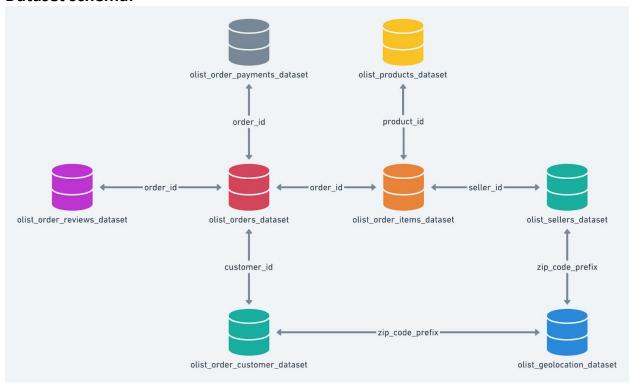

Features	Description
review_id	ID of the review given on the product ordered by the order id
order_id	A Unique ID of order made by the consumers
review_score	Review score given by the customer for each order on a scale of 1-5
review_comment_title	Title of the review
review_comment_message	Review comments posted by the consumer for each order
review_creation_date	Timestamp of the review when it is created
review_answer_timestamp	Timestamp of the review answered

The products.csv contain following features:

Features	Description
product_id	A Unique identifier for the proposed project.
product_category_name	Name of the product category
product_name_lenght	Length of the string which specifies the name given to the products ordered

product_description_lenght	Length of the description written for each product ordered on the site
product_photos_qty	Number of photos of each product ordered available on the shopping portal
product_weight_g	Weight of the products ordered in grams
product_length_cm	Length of the products ordered in centimeters
product_height_cm	Height of the products ordered in centimeters
product_width_cm	Width of the product ordered in centimeters

Dataset schema:

Problem Statement:

Assuming you are a data analyst/ scientist at Target, you have been assigned the task of analyzing the given dataset to extract valuable insights and provide actionable recommendations.

What does 'good' look like?

- I. Import the dataset and do usual exploratory analysis steps like checking the structure & characteristics of the dataset:
- A. Data type of all columns in the "customers" table.

We are retrieving the dataset of all the columns in the **customer table** from the information schema.columns and we have verified the column data types

Syntax

```
SELECT
column_name,data_type
FROM
neat-axis-409607.Market.INFORMATION_SCHEMA.COLUMNS
WHERE
table_name='customers';
```

```
SELECT
| column_name,data_type
FROM
| neat-axis-409607.Market.INFORMATION_SCHEMA.COLUMNS
WHERE
table_name='customers';
```

Output

JOB INFORMATION RESULTS		CHART PREVIEW
Row	column_name ▼	data_type ▼
1	customer_id	STRING
2	customer_unique_id	STRING
3	customer_zip_code_prefix	INT64
4	customer_city	STRING
5	customer_state	STRING

By understanding the data types of each table.

All columns names store consistency data types through the scheme.

Recommendations:

We ensure analysis and interpretation of the datasets.

B. Get the time range between which the orders were placed.

We need to check in **orders** table **order_purchase_timestamp** column to fetch the output. Need to retrieve the earliest and latest order based on the timestamp.

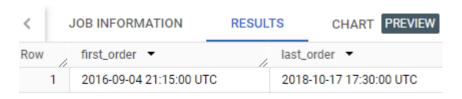

Below is the scheme of orders table

Syntax:

SELECT max(order_purchase_timestamp), min(order_purchase_timestamp) FROM `neat-axis-409607.Market.orders`;

```
SELECT max(order_purchase_timestamp),
min(order_purchase_timestamp) FROM `neat-axis-409607.Market.orders`;
```

Output:

Graph:

NA

This allowed us to determine the start and end dates of the data i.e, from Sep 04, 2016 to Oct 17, 2018

Recommendations

 We can analyze the orders based on time stamp along with delivery date too (estimated

C. Count the Cities & States of customers who ordered during the given period.

My understanding for this question is to pull the records from cities and states who ordered during given period and their count.

We need to views the **customer** table (for city and state) Used count to get the number of cities and states

Syntax:

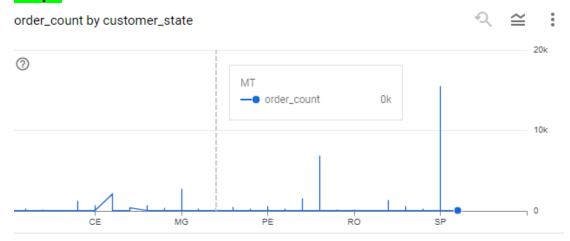

SELECT customer_state,customer_city,count(*) as order_count FROM neat-axis-409607.Market.customers c join neat-axis-409607.Market.orders o on c.customer_id=o.customer_id group by customer_state,customer_city order by customer state,customer city;

```
SELECT customer_state,customer_city,count(*) as order_count
FROM neat-axis-409607.Market.customers c
join neat-axis-409607.Market.orders o on c.customer_id=o.customer_id
group by customer_state,customer_city;
```

Output: No of records are 4310

Row	customer_state ▼	customer_city ▼	order_count ▼
1	RN	acu	3
2	CE	ico	8
3	RS	ipe	2
4	CE	ipu	4
5	SC	ita	3
6	SP	itu	136
7	SP	jau	74
8	MG	luz	2
9	SP	poa	85
10	MG	uba	53

Graph

Insights

We can see that SP state alone has more orders in Brazil.

Recommendations

Need to give some offers/discounts so that others country people shows interest to increase to place the orders.

II. In-depth Exploration:

A. Is there a growing trend in the no. of orders placed over the past years?

We need to extract from month and year from order_purchase_timestamp which is in orders table.

Syntax:

SELECT

Extract (MONTH from order_purchase_timestamp) as month, Extract (Year from order_purchase_timestamp) as Year, COUNT(order_id) AS order_count from neat-axis-409607.Market.customers c left join neat-axis-409607.Market.orders o on c.customer_id=o.customer_id group by month, year order by month, year;

```
SELECT
Extract (MONTH from order_purchase_timestamp) as month,
Extract (Year from order_purchase_timestamp) as Year,
COUNT(order_id) AS order_count from neat-axis-409607.Market.customers c
left join neat-axis-409607.Market.orders o on c.customer_id=o.customer_id
group by month,year
order by month,year;
```

Output:

Row	month ▼	Year ▼	//	order_count ▼
1	1		2017	800
2	1		2018	7269
3	2		2017	1780
4	2		2018	6728
5	3		2017	2682
6	3		2018	7211
7	4		2017	2404
8	4		2018	6939
9	5		2017	3700
10	5		2018	6873

Graph

Insights

There is increase in the orders with year-wise

Recommendations

We need to focus on the orders to increase the business from start up.

B. Can we see some kind of monthly seasonality in terms of the no. of orders being placed?

We need to extract from month and year from order_purchase_timestamp which is in orders table

Syntax

SELECT

EXTRACT(MONTH FROM order_purchase_timestamp) AS month,

```
COUNT(DISTINCT order_id) AS order_count FROM neat-axis-409607.Market.orders GROUP BY month ORDER BY month;
```

```
SELECT

EXTRACT(MONTH FROM order_purchase_timestamp) AS month,

COUNT(DISTINCT order_id) AS order_count

FROM

neat-axis-409607.Market.orders

GROUP BY

month

ORDER BY

month;
```

Output

Row	month ▼	//	order_count ▼
1		1	8069
2		2	8508
3		3	9893
4		4	9343
5		5	10573
6		6	9412
7		7	10318
8		8	10843
9		9	4305
10	1	0	4959

Seasonal variations in sales are observed, with increased sales during festive periods.

Recommendations

Businesses should plan their marketing and sales strategies in the peak seasons.

C. During what time of the day, do the Brazilian customers mostly place their orders? (Dawn, Morning, Afternoon or Night)

0-6 hrs : Dawn

7-12 hrs : Mornings

13-18 hrs : Afternoon

19-23 hrs : Night

We need to find the orders placed in during different times.

Syntax

SELECT

CASE

WHEN EXTRACT(HOUR FROM order_purchase_timestamp) BETWEEN 0 AND 6 THEN 'Dawn'

WHEN EXTRACT(HOUR FROM order_purchase_timestamp) BETWEEN 7 AND 12 THEN 'Morning'

WHEN EXTRACT(HOUR FROM order_purchase_timestamp) BETWEEN 13 AND 18 THEN 'Afternoon'

WHEN EXTRACT(HOUR FROM order_purchase_timestamp) BETWEEN 19 AND 23 THEN 'Night'

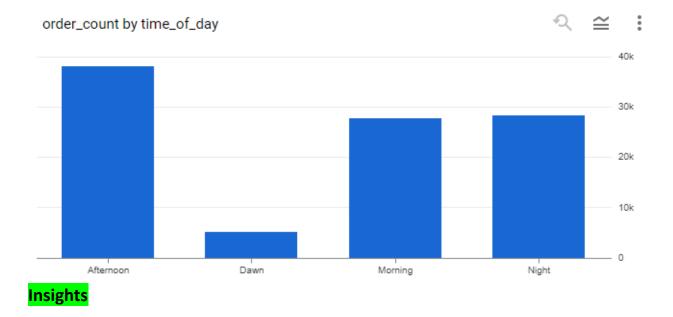

```
END AS time_of_day,
COUNT(*) AS order_count
FROM `neat-axis-409607.Market.orders`
```

```
GROUP BY
time_of_day
ORDER BY
time_of_day;
```

```
1 SELECT
2
       (CASE
3
            WHEN EXTRACT(HOUR FROM order_purchase_timestamp) BETWEEN @ AND 6 THEN 'Dawn'
4
            WHEN EXTRACT(HOUR FROM order_purchase_timestamp) BETWEEN 7 AND 12 THEN 'Morning'
5
            WHEN EXTRACT(HOUR FROM order_purchase_timestamp) BETWEEN 13 AND 18 THEN 'Afternoon'
           WHEN EXTRACT(HOUR FROM order_purchase_timestamp) BETWEEN 19 AND 23 THEN 'Night'
б
7
       END ) AS time_of_day,
8
9
       COUNT(*) AS order_count
10 FROM `neat-axis-409607.Market.orders`
11
12 GROUP BY
13
       time_of_day
14 ORDER BY
       time_of_day;
```

Output

Query results			
JOB IN	IFORMATION	RESULTS	CHART PREVIEW
Row	time_of_day ▼	//	order_count ▼
1	Afternoon		38135
2	Dawn		5242
3	Morning		27733
4	Night		28331

Orders are more during afternoon and low in Dawn.

Recommendations

We need to increase the orders by marketing campaigns, loyalty programs, and exceptional customer service experiences.

III. Evolution of E-commerce orders in the Brazil region:

A. Get the month on month no. of orders placed in each state.

We need get the customer state, order purchase timestamp from customer table and orders.

Syntax

select customer_state,EXTRACT(MONTH FROM order_purchase_timestamp) AS MONTH, count(1) as orders from neat-axis-409607.Market.customers c inner join neat-axis-409607.Market.orders o ON c.customer_id = o.customer_id group by customer_state,MONTH order by orders desc;

```
select customer_state,EXTRACT(MONTH FROM order_purchase_timestamp) AS MONTH, count(1) as orders
from neat-axis-409607.Market.customers c inner join neat-axis-409607.Market.orders o
ON c.customer_id = o.customer_id
group by customer_state,MONTH
order by orders desc;
```

Output

No of records are 322

Row	customer_state ▼	MONTH ▼	orders ▼
1	SP	8	4982
2	SP	5	4632
3	SP	7	4381
4	SP	6	4104
5	SP	3	4047
6	SP	4	3967
7	SP	2	3357
8	SP	1	3351
9	SP	11	3012
10	SP	12	2357

Graph

We have observed that SP state has been placed highest and AP has lowest orders

Recommendations

Company has give exciting offer to the customer to buy more products to rapid evolving in the market.

B. How are the customers distributed across all the states?

We need to count the states from customer table

Syntax

select customer_state, count(*) as customer_count from neat-axis-409607.Market.customers group by customer_state order by customer_state;

```
SELECT
c.customer_state,
COUNT(c.customer_id) AS no_of_customers
from neat-axis-409607.Market.customers c
GROUP BY
c.customer_state
ORDER BY
no_of_customers DESC;
```

Output

No of states are 27

Row	customer_state ▼	no_of_customers 🔻
1	SP	41746
2	RJ	12852
3	MG	11635
4	RS	5466
5	PR	5045
6	SC	3637
7	BA	3380
8	DF	2140
9	ES	2033
10	GO	2020

SP and RJ states has highest orders.

Recommendations

Need to implement customer retention strategies to encourage repeat purchases.

- IV. Impact on Economy: Analyze the money movement by e-commerce by looking at order prices, freight and others.
- A. Get the % increase in the cost of orders from year 2017 to 2018 (include months between Jan to Aug only).

You can use the "payment_value" column in the payments table to get the cost of orders.

We need calculate the % increase by using time stamp which is in order table, purchase from payments table.

Syntax

group by 1

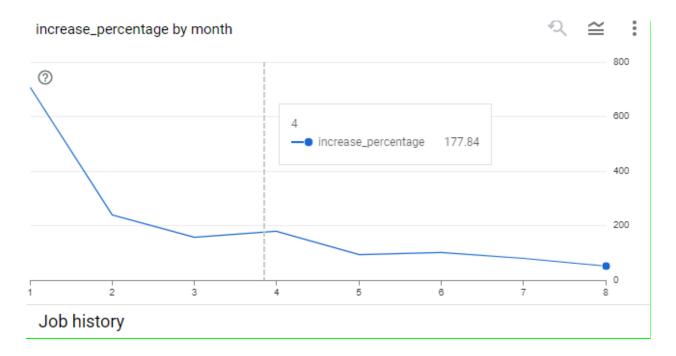

```
select month,
(((year_2018-year_2017)/year_2017)*100) as increase_percentage from
(SELECT
EXTRACT(MONTH FROM o.order purchase timestamp) AS month,
sum
(CASE
WHEN EXTRACT(YEAR FROM o.order purchase timestamp)=2017 and
EXTRACT(MONTH FROM o.order purchase timestamp) BETWEEN 1 AND 8
THEN p.payment value end) as year 2017,
sum
(case
WHEN EXTRACT(YEAR FROM o.order purchase timestamp)=2018 and
EXTRACT(MONTH FROM o.order purchase timestamp) BETWEEN 1 AND 8
THEN p.payment value end) as year 2018
from
`neat-axis-409607.Market.orders` o
JOIN
neat-axis-409607. Market.payments p ON o.order id = p.order id
WHERE
 EXTRACT(YEAR FROM o.order purchase timestamp) IN (2017, 2018) AND
 EXTRACT(MONTH FROM o.order purchase timestamp) BETWEEN 1 AND 8
```

order by 1);

```
select month,
(((year_2018-year_2017)/year_2017)*100) as increase_percentage from
(SELECT
EXTRACT(MONTH FROM o.order_purchase_timestamp) AS month,
(CASE
WHEN EXTRACT(YEAR FROM o.order_purchase_timestamp)=2017 and
EXTRACT(MONTH FROM o.order_purchase_timestamp) BETWEEN 1 AND 8
THEN p.payment_value end) as year_2017,
(case
WHEN EXTRACT(YEAR FROM o.order_purchase_timestamp)=2018 and
EXTRACT(MONTH FROM o.order_purchase_timestamp) BETWEEN 1 AND 8
THEN p.payment_value end) as year_2018
from
`neat-axis-409607.Market.orders` o
JOIN
neat-axis-409607.Market.payments p ON o.order_id = p.order_id
WHERE
 EXTRACT(YEAR FROM o.order_purchase_timestamp) IN (2017, 2018) AND
EXTRACT(MONTH FROM o.order_purchase_timestamp) BETWEEN 1 AND 8
group by 1
order by 1);
```

Output

Row	month ▼	1	increase_percentage
1		1	705.1266954171
2		2	239.9918145445
3		3	157.7786066709
4		4	177.8407701149
5		5	94.62734375677
6		6	100.2596912456
7		7	80.04245463390
8		8	51.60600520477

Orders has been increased due to New Year eve.

Recommendations

Need to provide offers, discounts or promotions during off-peak seasons.

B.Calculate the Total & Average value of order price for each state.

We need to fetch the columns customer state and order id from orders and order items tables

Syntax

SELECT c.customer_state, round(sum(price),2) as sum, round(avg(price),2) as Average FROM `neat-axis-409607.Market.order_items` o2 join neat-axis-409607.Market.orders o1 on o1.order_id=o2.order_id join neat-axis-409607.Market.customers c on

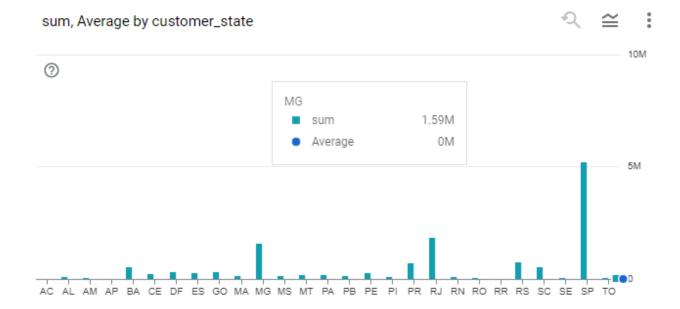

c.customer_id=o1.customer_id

GROUP BY c.customer_state ORDER BY c.customer_state;

```
1 SELECT c.customer_state,
2 COUNT(*) AS customer_count,
3 round(sum(price),2) as sum,
4 avg(price) as Average
5 FROM _neat-axis-409607.Market.order_items_ o2
6 join neat-axis-409607.Market.orders o1 on
7 o1.order_id=o2.order_id
8 join neat-axis-409607.Market.customers c on
9 c.customer_id=o1.customer_id
10
11 GROUP BY
12 c.customer_state
13 ORDER BY
14 c.customer_state;
```

Output

Row	customer_state ▼	sum ▼	Average ▼
1	AC	15982.95	173.73
2	AL	80314.81	180.89
3	AM	22356.84	135.5
4	AP	13474.3	164.32
5	BA	511349.99	134.6
6	CE	227254.71	153.76
7	DF	302603.94	125.77
8	ES	275037.31	121.91
9	GO	294591.95	126.27
10	MA	119648.22	145.2

The data reveals that the state of SP has the highest number of customers.

Recommendation

Company has to focus on customer interest to get the orders placed in other states by providing the personalized offers.

C.Calculate the Total & Average value of order freight for each state.

We need to fetch the columns customer state , fright value and order id from orders and order items.

Syntax:

SELECT c.customer_state, round(sum(freight_value),2) as freight_sum, round(avg(freight_value),2) as freight_Average FROM `neat-axis-409607.Market.order_items` o2 join neat-axis-409607.Market.orders o1 on o1.order_id=o2.order_id join neat-axis-409607.Market.customers c on c.customer_id=o1.customer_id

GROUP BY c.customer_state ORDER BY c.customer_state;

```
SELECT c.customer_state,
round(sum(freight_value),2) as freight_sum,
round(avg(freight_value),2) as freight_Average
FROM _neat-axis-409607.Market.order_items_ o2
join neat-axis-409607.Market.orders o1 on
o1.order_id=o2.order_id
join neat-axis-409607.Market.customers c on
c.customer_id=o1.customer_id

GROUP BY
c.customer_state
ORDER BY
c.customer_state;
```

Output

Row	customer_state ▼	freight_sum ▼	freight_Average 🔻
1	AC	3686.75	40.07
2	AL	15914.59	35.84
3	AM	5478.89	33.21
4	AP	2788.5	34.01
5	BA	100156.68	26.36
6	CE	48351.59	32.71
7	DF	50625.5	21.04
8	ES	49764.6	22.06
9	G0	53114.98	22.77
10	MA	31523.77	38.26

SP has the highest total price value and total freight value.

Recommendations

Company has to focus on enhance the logistics to provide smooth services.

V. Analysis based on sales, freight and delivery time.

A. Find the no. of days taken to deliver each order from the order's purchase date as delivery time. Also, calculate the difference (in days) between the estimated & actual delivery date of an order.

Do this in a single query.

You can calculate the delivery time and the difference between the estimated & actual delivery date using the given formula:

time_to_deliver = order_delivered_customer_date - order_purchase_timestamp diff_estimated_delivery = order_estimated_delivery_date order_delivered_customer_date

We need to fetch no of days by using orders table by using customer delivery date and timestamp

Syntax:

```
SELECT
```

order_id,

TIMEstamp_diff(order_delivered_customer_date,order_purchase_timestamp,day) as no_of_days_taken,

TIMEstamp_diff(order_estimated_delivery_date,order_purchase_timestamp,day) as diff_estimated_delivery_date,

DATE_DIFF(order_estimated_delivery_date, order_delivered_customer_date, DAY)

AS estimated_minus_actual_delivery_days

FROM neat-axis-409607. Market.orders

WHERE

DATE_DIFF(order_delivered_customer_date, order_purchase_timestamp, DAY) IS NOT NULL

order by no_of_days_taken;

```
SELECT
order_id,
TIMEstamp_diff(order_delivered_customer_date,order_purchase_timestamp,day) as no_of_days_taken,
TIMEstamp_diff(order_estimated_delivery_date,order_purchase_timestamp,day)as diff_estimated_delivery_date,
DATE_DIFF(order_estimated_delivery_date, order_delivered_customer_date, DAY)
AS estimated_minus_actual_delivery_days
FROM neat-axis-409607.Market.orders
WHERE
DATE_DIFF(order_delivered_customer_date, order_purchase_timestamp, DAY) IS NOT NULL
order by no_of_days_taken;
```

Output	
Row

Graph

Insights

Few are taking less time or within 1 day the orders are delivered.

Recommendations

We need to focus on delivery partner such as Fedex, where the orders has been delivery through mode of transport.

B.Find out the top 5 states with the highest & lowest average freight value.

We need to fetch the freight value on customers and orders tables.

Syntax

```
SELECT customer state,
ROUND(Avg(freight_value),2) AS avg_freight_value
FROM neat-axis-409607. Market.customers c
join 'neat-axis-409607. Market. orders' o1
using (customer_id)
join 'neat-axis-409607.Market.order items' o2
using (order_id)
GROUP BY customer state
order by avg_freight_value DESC
LIMIT 5
)
UNION ALL
SELECT customer_state,
ROUND(Avg(freight_value),2) AS avg_freight_value
FROM neat-axis-409607. Market.customers c
join 'neat-axis-409607. Market. orders' o1
using (customer id)
join `neat-axis-409607.Market.order_items` o2
using (order_id)
GROUP BY customer_state
order by avg_freight_value
LIMIT 5
);
```

```
(SELECT customer_state,
ROUND(Avg(freight_value),2) AS avg_freight_value
FROM neat-axis-409607.Market.customers c
join <u>`neat-axis-409607.Market.orders`</u> o1
using (customer_id)
join <u>`neat-axis-409607.Market.order_items`</u> o2
using (order_id)
GROUP BY customer_state
order by avg_freight_value DESC
LIMIT 5
UNION ALL
SELECT customer_state,
ROUND(Avg(freight_value),2) AS avg_freight_value
FROM neat-axis-409607.Market.customers c
join <u>`neat-axis-409607.Market.orders`</u> o1 using (customer_id)
join <u>`neat-axis-409607.Market.order_items`</u> o2 using (order_id)
GROUP BY customer_state
order by avg_freight_value
LIMIT 5
);
```

Output

Row	customer_state ▼	avg_freight_value
1	RR	42.98
2	PB	42.72
3	RO	41.07
4	AC	40.07
5	PI	39.15
6	SP	15.15
7	PR	20.53
8	MG	20.63
9	RJ	20.96
10	DF	21.04

RR has highest freight value and SP state has lowest freight value.

Recommendations

Evaluate freight fees should be done frequently to focus on increase in orders.

C.Find out the top 5 states with the highest & lowest average delivery time.

We need to fetch the average delivery time on customers and orders tables.

Sytnax

```
(
SELECT customer_state,
round(AVG(DATE_DIFF(order_delivered_customer_date,
order_purchase_timestamp, DAY)),2) AS avg_delivery_time

FROM `neat-axis-409607.Market.orders`o
join neat-axis-409607.Market.customers c
using (customer_id)
GROUP BY customer_state
order by avg_delivery_time DESC
LIMIT 5
)
```

UNION ALL

```
(
SELECT customer_state,
round(AVG(DATE_DIFF(order_delivered_customer_date,
order_purchase_timestamp, DAY)),2) AS avg_delivery_time
FROM `neat-axis-409607.Market.orders`o
join neat-axis-409607.Market.customers c
using (customer_id)
GROUP BY customer_state
order by avg_delivery_time DESC
LIMit 5 offset 6);
```

Output

Row	customer_state ▼	avg_delivery_time >
1	RR	28.98
2	AP	26.73
3	AM	25.99
4	AL	24.04
5	PA	23.32
6	SE	21.03
7	CE	20.82
8	AC	20.64
9	PB	19.95
10	PI	18.99

Graph

Insights

RR has highest delivery time and SE has lowest delivery time.

Recommendations

Need focus on delivery agencies to improve the turnaround time on delivery time.

D.Find out the top 5 states where the order delivery is really fast as compared to the estimated date of delivery.

You can use the difference between the averages of actual & estimated delivery date to figure out how fast the delivery was for each state.

We need to fetch the data by using customers and orders table to showcase the 5 states on order delivery very fast.

Syntax

select c.customer_state, round(avg(date_diff(order_estimated_delivery_date,order_purchase_timestamp, day)),2) as order_delivery from neat-axis-409607.Market.orders o

join neat-axis-409607.Market.customers c on c.customer_id=o.customer_id GROUP BY c.customer_state order by customer_state,order_delivery asc limit 5;

```
select c.customer_state,
round(avg(date_diff(order_estimated_delivery_date,order_purchase_timestamp,day)),2) as order_delivery
from neat-axis-409607.Market.orders o
join neat-axis-409607.Market.customers c on c.customer_id=o.customer_id
GROUP BY
c.customer_state
order by
order_delivery asc
limit 5;
```

Output

Row	customer_state ▼	order_delivery ▼
1	SP customer_state	18.81
2	DF	24.06
3	MG	24.22
4	PR	24.25
5	ES	25.27

SP state has the fast delivery the orders.

Recommendations

We can consider the distance and geographic location may be orders got delayed, we need to focus on best delivery agencies such as DHL, Fedex etc to reduce the turnaround time on deliveries.

VI. Analysis based on the payments:

A. Find the month on month no. of orders placed using different payment types.

We need to use payments tables for timestamp and payment columns join with orders table.

Syntax

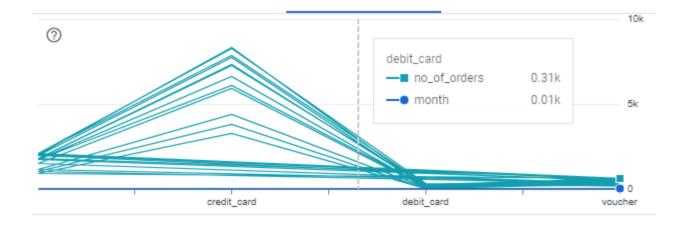

SELECT

extract(Month from order_purchase_timestamp) as month, payment_type, count(*) as no_of_orders FROM `neat-axis-409607.Market.payments` p left join neat-axis-409607.Market.orders o on p.order_id=o.order_id

group by month,payment_type order by month,payment_type;

Output

JOB INFORMATION		RESULTS		CHART PREVIEW	JSON
Row	month ▼	//	payment_type	•	no_of_orders ▼
1		1	UPI		1715
2		1	credit_card		6103
3		1	debit_card		118
4		1	voucher		477
5		2	UPI		1723
6		2	credit_card		6609
7		2	debit_card		82
8		2	voucher		424
9		3	UPI		1942
10		3	credit_card		7707

Credit card transactions are the most popular payment method.

Recommendations

Need to provide the offers based out payments with debit card or cash on delivery.

B.Find the no. of orders placed on the basis of the payment installments that have been paid.

We need fetch the records from payments and orders table to show the payment installments along with month.

Syntax:

SELECT

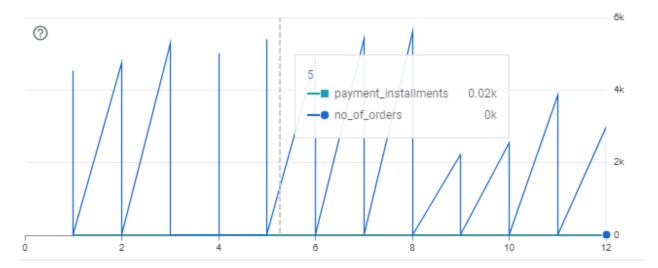

extract(Month from order_purchase_timestamp) as month, payment_installments, count(*) as no_of_orders FROM `neat-axis-409607.Market.payments` p left join neat-axis-409607.Market.orders o on p.order_id=o.order_id group by month,payment_installments

order by month, payment_installments, month;

```
SELECT
extract(Month from order_purchase_timestamp) as month,
payment_installments,
count(*) as no_of_orders
FROM __ineat_axis_409607.Market.payments__i p
left __join neat_axis_409607.Market.orders o on p.order_id=o.order_id
group by month,payment_installments
order by month,payment_installments;
```

Output

Row	month ▼	/	payment_installment	no_of_orders ▼
1		1	1	4545
2		1	2	964
3		1	3	834
4		1	4	552
5		1	5	394
6		1	6	289
7		1	7	113
8		1	8	320
9		1	9	34
10		1	10	346

The highest number of installments is 24, which is associated with 18 orders.

Recommendation

Need to encourage the customers by providing the offers on payment gateway to improve customer satisfaction.

In conclusion

By taking the above all analysis into consideration, company has to focus on strategies on growth of the business in many aspects.

Evaluation Criteria (100 points)

- 1. Initial exploration like checking the structure & characteristics of the data (15 points)
- 2. In-depth Exploration (15 points)
- 3. Evolution of E-commerce orders in the Brazil region (10 points)
- 4. Impact on Economy (20 points)
- 5. Analysis on sales, freight and delivery time (20 points)
- 6. Analysis based on the payments (10 points)
- 7. Actionable Insights & Recommendations (10 points)

Submission Process

Once you're done with the case study...

- Use a Word document to paste your SQL queries along with a screenshot of the first 10 rows from the output.
- List down any valuable insights that you find during the analysis and provide some action items from the company's perspective in order to improve the current situation.
- Convert your solutions doc into a PDF, and upload the same on the platform.
- Please note that after submitting once, you will not be allowed to edit your submission.
